Training Course on Gender Statistics

Hasnani Rangkuti, Ph.D
BPS-Statistics Indonesia

Presented at the Bangladesh Bureau of Statistics (BBS)
Bangladesh, 29-31 January 2017
Introduction

Please kindly introduce yourself:
- Name
- Occupation
- Working experience
- Knowledge on gender
- Need and expectation from the workshop
Objective of Training Course

1. To understand the concept of gender.
2. Is able to produce gender statistics.
3. To gain a better understanding on gender concerns in SDGs.
1. What gender statistics are
2. Demographic indicators for gender statistics
3. Gender and economic activity
Module 1:

Basic Concept of Gender Statistics
Materials

- What is gender?
- General skills for understanding and using statistics
- Key statistical concepts
- Understanding gender statistics
What is Gender?

Anyone?
Let's familiar with some CONCEPTS
Gender

Refers to the economic, social, political, and cultural attributes and opportunities associated with being male or female.

The social definitions of what it means to be a woman or a man vary among cultures and change over time.

OECD, 1998
# Sex vs. Gender

<table>

Gender Equity
Process of being fair to women and men, including using measures to compensate for historical and social disadvantages that prevent men and women from operating on a level playing field.

CIDA, 1996

Gender Equality
The state or condition that affords women and men equal enjoyment of human rights, socially valued goods, opportunities, and resources.

SIDA, 1997
Gender Integration & Mainstreaming

Gender Integration
Refers to strategies applied in program assessment, design, implementation, and evaluation to take gender norms into account and to compensate for gender-based inequalities.

Gender Mainstreaming
The process of incorporating a gender perspective into policies, strategies, programs, project activities, and administrative functions, as well as institutional culture of an organization.
Women’s Empowerment
Improving the status of women to enhance their decision-making capacity at all levels, especially as it relates to their sexuality and reproductive health.

Constructive Male Engagement
Involves men in actively promoting gender equity with regard to reproductive health, increases men's support for women's reproductive health and children's well-being, and advances the reproductive health of both men and women.
“All human beings are born free and equal in dignity and rights.”
What type of Equality?

1. **Formal Equality**
   - **View:** Women and men are the same so treat them the same
   - **Goal:** To achieve equal treatment
What type of Equality?

2. Protectionism

• View: Women and men are different so should be treated differently
• Goal: To protect women
3. Substantive equality

- **View:** There are differences in how women and men experience life and we should minimize negative effects of this
- **Goal:** Promote equality of outcomes
That is the **Substantive Equality**

- Corrective approach
- Equal treatment can reinforce inequality
- Discrimination and inequality are social constructs
- Requires proactive measures
- Equality of opportunity, access and results
Travel back in time...
Women - Development

- Women IN Development (WID)
- Women AND Development (WAD)/GAD
- Gender Mainstreaming (GM) – Gender Integration
The benefits of development had not reached women.

In some economic sectors women’s position was undermined.

Women should be integrated into the design and implementation of development programs through legal and administrative changes.
WID advocates sought to change development practices by pushing governments and international organizations to:

- include women in development projects
- respond to specific concerns and problems of women,
The emphasis on incorporating women into development processes succeeded in:

- Focusing attention on the shortcomings of development policies practiced in the 1950s and 1960s.
- Expanding the documentation, including sex disaggregated data, on women’s roles in economic and social systems.
- Establishing goals and plans for improving women’s status around the globe.
- Increasing the representation of women in official government positions.
- Changing many inequitable laws that discriminated against women.
- Mobilizing women at the grassroots level around the world.
Critics for WID

- Accepted traditional liberal economic theory about the nature of development.
- Assumed women were not already integrated into economic production.
- Influenced by American feminism: accepted existing social and political structures.
- Assumed women all had common problems and interests.
- De-emphasized the family and community contexts affecting women’s activities.
- Often resulted in separate projects for women apart from broad development programs.
- Non-confrontational, thus failed to transform the fundamental status of women.
The critics leads to the WAD/GAD

WAD/GAD approaches argued that:

1. Development processes in poor countries or less-developed countries (LDCs) were deeply influenced by the inequitable structures of the international economic system.

2. Women have always been integrated into development processes, but those processes essentially flawed.

3. Men, as well as women, are hurt by development programs that do not alter repressive class, ethnic, and racial structures.

4. One cannot assume women’s solidarity across class and racial lines, but patriarchal values and institutions may oppress women in every social-economic category.
5. Development policies should not isolate women’s productive or reproductive roles: they are intertwined in women’s lives.

6. Women are agents of change and must organize politically.

7. Successful development does not “target” women, it empowers them.
Gender Mainstreaming

- 1985: Concept first introduced
- 1995: Further developed at UN Fourth World Conference on Women
- Beijing Platform: “Promote an active and visible policy of mainstreaming a gender perspective”
- Gender integration
Gender Mainstreaming

A Strategy to ensure women’s and men’s concerns and experiences are included in the design, implementation and evaluation of policies and programs

Goal: achieving gender equality
Empowerment

“Empowerment” is a relatively new term for the long-standing recognition that women and disadvantaged men must be organized to make a difference in the structures of power that confine them to secondary status.

It is process through which women and men in disadvantaged positions increase their access to knowledge, resources, decision-making power, and raise their awareness of participation in their communities, in order to reach a level of control over their own environment.

The Vienna conference on human rights (1993) included “women’s rights as human rights”.

The Cairo conference on population and development (1994) addressed women’s needs for access to health, maternal care, and family planning facilities.

The Fourth World Conference on Women in Beijing (1995) built on earlier international conferences, national government efforts, and lobbying by NGOs to develop gender-sensitive strategies in its Platform for Action.
Gender Mainstreaming: Through

- Institution
- Policy
- Program
Gender Mainstreaming

- Every policy and activity has a gender perspective or implication.
- Gender analysis improves the effectiveness of policies and programs.
- Needs and rights of all stakeholders are addressed.
Objective

- Make gender more visible
- Transform institutions
- Ensure that power and resources are deployed equitably
Some myths

- Favors women over men
- Women and men already equal
- Only for policies related to women and women’s issues
Continuum of Gender Mainstreaming

- Exploitative
- Accommodating
- Transformative
- Gender Blind
- Gender Aware
1. Design
   - Gender analysis/needs assessment
   - Gender planning

2. Start-up
   - Gender-specific action/capacity building
   - Gender-sensitive M&E

3. Implementation
   - Knowledge sharing
   - Gender expertise
   - Adequate resources

4. M&E
   - Gender-sensitive M&E
   - Gender-specific action/capacity building

GM – Life cycle
GM - Strategies

- Involve women and men in consultations.
- Include sex-disaggregated data.
- Formulate gender-sensitive and/or specific objectives, indicators and activities.
- Strive for gender balance in staff/experts.
- Enable women and men to participate equally and benefit equally.
- Include gender in evaluations.
GENDER MAINSTREAMING STRATEGIES/TOOLS

• Strive for gender balance in staff/experts
• Enable women and men to participate equally and benefit equally
• Include gender in evaluations
Discussion

Let's have some discussions
Gender analysis draws on social science methods to examine relational differences in women’s and men’s and girls’ and boys’

- roles and identities
- needs and interests
- access to and exercise of power

and the impact of these differences in their lives and health.
Gender Analysis

- Can be undertaken at any stage but most effective if included in design
- Systematic way of analyzing different roles and impacts
- Asks the “who” questions
- How will this affect women and men?
Examine different domains of gender relations

- Practices, Roles, and Participation
- Knowledge, Beliefs, and Perceptions
- Access to Resources
- Rights and Status

POWER

POWER
Gender constraints and opportunities need to be investigated in specific contexts, as they vary over time and across ...

**Social Relationships**
- Partnerships
- Households
- Communities
- Civil society and governmental organizations/institutions

**Sociocultural Contexts**
- Ethnicity
- Class
- Race
- Residence
- Age
What different constraints and opportunities do women and men face?

- How do gender relations (in different domains of activity) affect the achievement of sustainable results?
- How will proposed results affect the relative status of men and women (in different domains of activity)?
Different Domains of Gender Analysis

- Legal rights and status
- Knowledge, beliefs and perceptions
- Practices, roles and participation
- Access to assets
Gender Analysis

Gender-based Opportunities

= gender relations (in different domains) that facilitate men’s or women’s access to resources or opportunities of any type.

Gender-based Constraints

= gender relations (in different domains) that inhibit men’s or women’s access to resources or opportunities of any type.
Statistics that adequately reflect differences and inequalities in the situation of women and men in all areas of life. Gender statistics are the sum of the following characteristics:

- data are collected and presented disaggregated by sex as a primary and overall classification;
- data are reflecting gender issues;
- data are based on concepts and definitions that adequately reflect the diversity of women and men and capture all aspects of their lives; and
- data collection methods take into account stereotypes and social and cultural factors that may induce gender biases.
General skills for understanding and using statistics

- data awareness
- the ability to understand statistical concepts
- the ability to analyse, interpret and evaluate statistical information, and
- the ability to communicate statistical information and understandings

The employment rate is the percentage of the total adult population (aged 15 and above) who are employed. It is calculated by dividing the employed population by the total population, and then multiplying the result by 100 to get a percentage figure (usually expressed to one decimal point).

The formulas for calculating female and male rates are below:

$$\frac{\text{Female employed age 15+}}{\text{Female population aged 15+}} \times 100 = \text{Female employment aret (%)}$$

$$\frac{\text{Male employed age 15+}}{\text{Male population aged 15+}} \times 100 = \text{Male employment aret (%)}$$
Employment rate (%) for population aged 15 and above, by sex, selected countries, year as indicated

Some comments regarding the table?

End of Module 1.
Module 2:

Demographic indicators for gender analysis
Materials

- Importance of demographic indicators for gender analysis
- Data sources
- Understanding the key indicators
Importance of demographic indicators for gender analysis

- What is demography?
- Demography and gender
Data Sources

- Population censuses
- Demographic and Health
- Administrative registers
Understanding the key indicators

- Sex ratio for total population
- Infant mortality
- Mean age at first marriage
- Total fertility rate
Sex Ratio

Key messages from the graph?
Sex ratio: What impacts on sex ratio?

- Tendency for women to live longer
- Son preference
- Employment-related migration
- Risks to health, such as alcohol, smoking and violence
- Wars and conflicts

Policy implications?
Infant mortality rate (IMR)

- Infant mortality rate is the probability of a child born in a specific year or period dying before reaching the age of one, expressed as rate per 1,000 live births.
- Infant
- Mortality rate
- Live births
Infant Mortality Rate, by sex, selected countries, 2010

Key messages from the graph?
How to interpret this indicator

- Aiming for low rates over time
- Rates tend to be higher for males
- Examine variation between sub-populations

Policy Implications?
The mean age at first marriage is the mean age of men or women at first marriage if subject throughout their lives to the age-specific marriage rates of first marriages only in a given year.

- Marriage
- Mean age
Age at first marriage for many women represents the time they are first exposed to risks of pregnancy and childbearing. Therefore, younger age of first marriage is generally associated with higher fertility rates. Globally, the trend over time is that the age at first marriage is increasing.

- Child marriage
- Look at changes over time
- Look at differences between men and women
- Consider related indicators

Policy Implications?
The Total Fertility Rate (TFR) is calculated based on age-specific fertility rates and is expressed as the number of children per woman.

The total fertility rate is defined as the average number of children that would be born alive to a woman during her lifetime if she were to pass through her childbearing years conforming to the age-specific fertility rates of a given year.
Gender issues impact on fertility:
Factors that could be considered in analysis of trends in fertility:
- Status of women
- Marital status
- Son preference
Family planning
Adolescent fertility rate
Male fertility

Policy implications?
## Total Fertility Rate, selected countries, 1980-2010

</table>
Fertility is highest in Tajikistan, with an average of 3.8 children per woman in 2010.

Fertility is low in Armenia, Azerbaijan, Belarus, Georgia, Republic of Moldova, Russian Federation, and Ukraine, with rates at or below 2.0 children per woman since 2000.

Changes in fertility tend to take place slowly over time, although rates have declined swiftly in Uzbekistan, Turkmenistan and Tajikistan since 1980.

Policy implications?
Discussion

End of Module 2
Module 3:

Gender and economic activity
Materials

- Relationship between gender and economic activity
- Overview of how economic activity is measured
- Productive, non-productive, economic and non-economic activities
- Labour force (employed + unemployed) and economic inactivity (outside the labour force)
- Data sources
- Understanding the key indicators
Typical gender gaps in economic activity:

- Women are less likely to participate in the labour force than men.
- Employed women work less hours in employment than men.
- Women earn less income than men.
- Men are more likely to work in mining and construction industries.
- Women are more likely to work in the services sector.
Measuring economic activity involves clear definitions of work.

Activities are either productive or non-productive.

Activities that are considered as ‘economic production’ count towards the gross domestic product (GDP).
Economic production as defined by system of national account

ALL ACTIVITIES

Productive activities

Non-productive activities
Examples: 1. Basic human activities (eating, etc.); 2. Purely natural processes; 3. Studying

Economic production

Non-economic production
Examples: cleaning, cooking, repairing, caring for others, transporting

Production of all goods

Production of all market services

Production of all goods for the market

Production of all goods for own use

Production of all paid domestic and personal services

Production of all housing services for own use*

Market production

Non-market production

* No labour input.
Different forms of work

1. Own-use production work comprising production of goods and services for own final use.

2. Employment work comprising work performed for others in exchange for pay or profit.

3. Unpaid trainee work comprising work performed for others without pay to acquire workplace experience or skills.

4. Volunteer work comprising non-compulsory work performed for others without pay.

5. Other work activities (not defined in the ILO resolution).
Key messages from the graph:

The graph shows the inactivity rates in various countries, year as indicated. For the countries and years specified:

- Moldova, Republic of (2010): 60.3% Female, 55.3% Male
- Georgia (2010): 54.0% Female, 39.7% Male
- Kyrgyzstan (2010): 47.3% Female, 22.8% Male
- Belarus (2012): 45.8% Female, 38.8% Male
- Russian Federation (2010): 44.3% Female, 29.8% Male
- Azerbaijan (2010): 41.4% Female, 34.2% Male
- Kazakhstan (2012): 33.4% Female, 23.0% Male

This graph shows the inactivity rates in the table above, sorted from highest to lowest.
How to interpret this indicator

- Look for differences between men and women -
- Look at reasons for inactivity
- Look for differences between certain age-groups and family situations
- Consider the impacts of events
- Compare to other countries

Policy implications?
The employment rate is the share of employed persons in a particular population (e.g. rural based women aged 15-49, or all men aged 15 and above). It is also known as the employment to population ratio.

Key definitions:
- Employment
- In kind
Employment rate (%) for population aged 15 and above, by sex, various countries, year as indicated.

Key messages from the graph?
How to interpret this indicator

- Look for differences between men and women -
- Look for changes over time
- Look for differences between certain age-groups and family situations
- Consider the impacts of events
- Compare to other countries
- Accuracy of the data

Policy implications?
Gender pay gap

The difference between men’s and women’s average earnings from employment, shown as a percentage of men’s average earnings.

**Gender Pay Gap in hourly wage rates refers** to the gender gap in average hourly earnings. This indicator aims to capture the difference between men’s and women’s overall position in the labour market. It measures the difference between men’s and women’s wage rates independent of the number of hours worked, the type of activity or the type of occupation.

**Gender Pay Gap in monthly earnings refers** to the gender gap in average monthly earnings. This indicator aims to capture the variance between men’s and women’s earnings over a specific period of time. It reflects differences in time worked and type of work performed, which translates into gender differences in economic autonomy.
How to calculate:
The gender pay gap is the difference between average hourly wage rates of men and women, expressed as a percentage of average hourly wage rates of men. If a woman earns 70% percent of what a man earns, then the gender gap is 30 percentage points.

Key messages from the graph?
How to interpret this indicator

- Understand what the number represents
- Examine particular professions and industries
- Explore how the gap varies by age and family situation

Policy implications?
Discussion?
